

Test & Drain Valve

Description

A Test and Drain is a type of valve with both a test function and express drain function. Kind of a ball valve and Inspector's Test valve combination, except it is manufactured as one unit making it much more convenient. Its dual-purpose design enables system draining, when required, but also aids in required testing insprinkler system complying NFPA requirements.

The compact, easy-to-use nature make Test & Drain valves quite handy for the fire protection industry as they simplify the installation of the system by cutting out extra components. In comparison to a standard ball valve and an Inspector's Test valve, a Test and Drain means lower cost, less parts, easier installation, and thus offer multiple uses.
