

## Copper Network Cables

### Description

Copper cabling has been used in the communications industry for more than 100 years, and it is still in use in many networks today. While there have been several advances in network technology in recent years, with fibre-optic networks and wireless networks becoming more popular, copper cables still dominate most networks because they are affordable, fast and reliable. There are several different kinds of copper network cabling.

It is important that you choose the right kind of copper wire data cabling for your network's needs. Some business owners are reluctant to invest in copper cables because fibre-optic technology provides even greater bandwidths. However, for most business applications there is no need for the extra bandwidth that fibre-optic technology provides. Copper cabling is fast, reliable and affordable and is also easy to maintain.

If you would like to know which technology is the best choice for your network, please do not hesitate to contact our team of networking professionals.
