

## Incinerator for General Waste

### Description

Most of the general wastes like food, wood, paper, glass, etc can be recycled effectively and can also be a source of revenue due to their recyclability. If there is no segregation of waste at source or segregated waste is remixed with hazardous waste material, the entire waste stream can become hazardous.

Most countries have their version of Municipal Solid Waste Management Rules. It is also possible to generate power by incinerating wastes like food, paper or other garbage or by composting of bio-degradable wastes like food waste, animal dung etc. It is to be noted that material like glass or metals are not to be incinerated.
