

Macerators

Description

Specification and sizing for your maceration application will depend on the composition of the material in the flow. Figures detailed are based on maceration of standard raw sewage and sewage sludge.

Applications involving digestate feedstock, food process waste and other contents will require validation by Haigh prior to formal quotation, our team are more than happy to help you with this process even if you do not have complete information at this stage.

Hole sizes will also affect the throughput of your equipment, with finer particle size maceration introducing an increased headloss and slight de-rating of the equipment.
